

ZONULY · A REFERRAL ENGINE FOR ENGINEERS

Get referred, not filtered.

A portal application is one of 800. A referral from an engineer puts you in a stack of ten. ZoNuLy finds the funded startups nobody has heard of yet, proves they are hiring, finds the engineers who can refer you, and writes the ask — then stops for your approval.

LIVE AT [DASHBOARD-BLUE-EIGHT-86.VERCEL.APP](https://dashboard-blue-eight-86.vercel.app)

Four things stand between a strong student and a ₹30 L+ role — and all four are mechanical.

1 • You never see the good jobs

Funded startups post on their own careers page and wait. By the time an aggregator lists the role, hundreds have applied.

2 • You can't tell which are worth your time

"AI Engineer" spans eight years of ML to founding-engineer-for-a-strong-student. Only reading the JD against the résumé tells you which.

3 • Cold applications go nowhere

A portal submission is one of 800. A referral from an engineer, even a weak one, puts you in a stack of ten.

4 • Referrals don't scale by hand

Find a person, their role, their email, their work; write something that isn't a template; send; follow up; track. Twenty minutes each — and there is coursework.

Search, filtering, drafting and follow-up are machine work. Human judgement matters at exactly one moment: **"yes, send that to that person."**

The pay gap is geographic. The winners are the companies nobody has heard of yet.

AN ENGINEER IN AN OFFICE IN THE US / UK / GERMANY
COSTS

₹1.5–2 Cr

a year, all-in

VS

THE SAME COMPANY HIRES AN EQUALLY CAPABLE ENGINEER
REMOTE FROM INDIA FOR

₹20–50 L

and it is a rounding error to them

Who exploits the gap

Recently funded startups — seed to Series B — with money, a role to fill, and no time. They hire remote from anywhere, no visa needed.

Who doesn't

Google, Microsoft, Amazon and the household names: hyped, oversubscribed, DSA-gated. Thousands of applicants per role. Not where the odds are.

So the target is

US / UK / EU companies hiring remote from India at any well-paid local rate, and Indian companies on-site at ₹30 L+. Every company gets an honest grade — a low grade decides ordering, never whether we try.

From "a company exists" to "an engineer there has your résumé" — with one human step.

The 25-a-day cap is the real ceiling — so everything upstream is about spending 25 emails well: the right company, the right person, the right sentence.

One day of running it, on an 8 GB laptop, for ₹0.

1,957

companies mapped

US 1,229 · remote 407 · UK 93 · India 93 · EU 101

948

hiring proven on their own site

783 unbacked claims rejected

2,088

open roles

1,439 fresher · 468 say "work from anywhere"

3,737

leads who can refer

3,620 with verified emails · 288 companies

1,779

companies with a description read from their own site

1,355 with the founding story

349

companies that can pay a fresher ₹30–40 L stated in a posting, or Pay Power $\geq$ 65

89

ready to ask today

hiring proven · fresher role · remote-from-anywhere · a lead with an email

Nothing is invented. Every number carries the sentence it was read from.

Hiring is proven	Only the company's own board or careers page counts. 783 "we're hiring" claims failed that test today and were labelled, not repeated.
Pay is graded openly	The Pay Power benchmark is printed next to every score, with the sentence that decided it.
People are evidenced	A lead is an engineer who commits to the company's public repos, with a verified address — never a scraped LinkedIn.
Hard limits, not settings	No logged-in LinkedIn automation. 25 emails a day. One follow-up, never two. Nothing sends without a human reading it.

PAY POWER — CAN THEY PAY A FRESHER ₹30–40 L?

BAND	SCORE	RULE
Pays	100	a posting states ≥ ₹30 L — they wrote the number
Deep pockets	85	\$10M+ in 24 months, Series A+ in 30, or valued ≥ \$50M
Funded	65	\$3–10M in 30 months, or a YC batch with a team of 10+
Thin	30	under \$2M, pre-seed, or the raise is stale
Unknown	0	nothing found — needs research, not an email

"raised seed \$12M 8 months ago, US HQ — able to pay a \$40k remote engineer without noticing"

THE PRODUCT

A market map to filter by, and one page per company with everything on it.

The Atlas. Five industry-chain layers, 34 market segments sized by companies. Click segments, flip switches — hiring proven, fresher roles, hire from anywhere, has a lead — and the matching companies appear below.

Cohere **ready to ask**

United Kingdom · roles in Toronto, London, Ottawa · AI agents & automation

Enterprise-ready AI platform providing generative language models, speech recognition, agentic coding, document parsing, and semantic search models for businesses.

Website Careers GitHub

The hiring post
Where we saw that they are hiring — the thing to show if anyone asks

open postings on their ashy board
the company itself on their own job board · 2026-09-03

ashly board 'cohere' is live with 144 open postings(s)

Re-check on their site

Roles (16 fresher · 8 senior)
Fresher roles first. Senior titles are kept so you can see they are hiring, not to apply to.

Forward Deployed Engineer, Agentic Platform (Korea)	Korea
Software Engineer, Security	Toronto
Forward Deployed Engineer, Infrastructure Specialist (Public Sector)	Ottawa
Research Scientist, Cohere Labs	London
Audio Inference Engineer, Model Efficiency	New York
Software Engineer, GPU Infrastructure (HPC)	Canada
Site Reliability Engineer, Inference Infrastructure	Toronto

One company, one page. Who they are and how they started · the hiring post on record (who posted it, where) · roles, fresher first · the leads to reach with a Draft button · Pay Power with its sentence.

Local-first, ₹0 recurring, runs on a student laptop — and deployed.

Pipeline

Python 3.12 · SQLite · FastAPI. Every stage commits per item, so a kill loses nothing and a rerun resumes. A knowledge graph (8,000+ nodes) records every decision and the evidence behind it.

Data, all public

YC directory · Greenhouse / Lever / Ashby boards · Hacker News · X hiring posts · the company's own site and About page · GitHub commit history · Exa company index. No LinkedIn session, ever.

Models

Free models through OpenRouter, behind a cost ledger and daily caps. The model reads text we fetched and returns fields with the quote they came from; a field without its quote is dropped.

Front end

Next.js dashboard: Atlas, Companies, Leads, review Queue, Replies, Tracker. Global search, serial numbers, one-click drafts.

Deployed

Docker image on Railway (API, read-only public mode with masked emails) and Vercel (dashboard). Same image runs the nightly passes on any always-on box.

Cost

₹0 a month to run. The only paid key is a \$10 search credit that covers ~1,000 company lookups. GitHub, X and every company site are free.

Twenty-five honest emails a day, to the right people, adds up.

500

sends a month

25 a day × 20 working days, per person

25–50

replies

5–10%, from real engineers and founders

8–20

referrals, calls, assessments

after the "hiring is done" replies

3–8

interviews a month

at companies that pay in dollars

What "done" looks like

Open the app once a day. Overnight it found companies you had never heard of, proved they are hiring, graded what they pay, found the engineers who can refer you and wrote the emails. Read the queue, fix the lines that don't sound like you, approve. Ten minutes.
